

# Theme Config Test

*Most settings loaded from sample.theme*

*By Theme Default Author*

# Table of contents

## 1. Theme file

### 1.1 Larger headings and body

## List of tables

**Table 1.1:** Table rendered at the theme's table\_size

## List of code blocks

**Code block 1.1:** Highlighted with the front-matter override (monokai)

# 1. Theme file

This document sets only `theme: sample.theme`, plus a `code_theme: monokai` override. Everything else — `locale`, `author`, `page_size`, `margins`, `toc_depth`, and the font sizes — comes from `sample.theme`.

Precedence is `DEFAULT_META < .theme < front matter`, so `code_theme: monokai` here wins over the theme's `nord`, while `author: Theme Default Author` comes straight from the theme (this `.md` sets no author).

```
def main():
    print("theme override works")
```

*Code block 1.1: Highlighted with the front-matter override (monokai)*

## 1.1 Larger headings and body

The `text_size`, `title_size`, `h2_size`, and `table_size` from the theme apply throughout, with no per-document tuning.

| Source              | Setting                 | Where it came from |
|---------------------|-------------------------|--------------------|
| <code>.theme</code> | <code>code_theme</code> | overridden here    |
| front matter        | <code>code_theme</code> | wins (monokai)     |

*Table 1.1: Table rendered at the theme's `table_size`*
